

CS2102 Database Systems

INTRODUCTION

Lecturer: A/P Lee Mong Li

leeml@comp.nus.edu.sg

Office: COM-2 #03-06

1

- ❖ CS2102 is an introductory course on databases
 - Learn the concepts and techniques for the design and programming of database applications with relational database management systems
- ❖ First lecture
 - We discuss the rationale and outline the syllabus of the course

2

What is a Database Application?

- ❖ A database application is a collection of data and the programs that allow the manipulation of these data
- ❖ Examples:
 - Banking - accounts, transactions
 - University - student registrations, grades
 - Airline - reservations, schedules
 - Sales - customers, products, purchases
 - Manufacturing - production, inventory, orders

3

What is a Database Management System (DBMS)?

- ❖ A DBMS is a generic platform for the development and management of database applications
- ❖ Example commercial DBMS:
 - Oracle
 - Sybase
 - DB2
 - Microsoft SQL Server
 - MySQL
 - Microsoft Access

4

Features of a DBMS

5

Data must Persist

- ❖ How can data survive the process that created it, and be reused by other processes?
- ❖ Primary memory is volatile
- ❖ Secondary and tertiary memories are persistent

6

Data Comes in Large Amounts

- ❖ There were 176 million voters in the 2009 Indonesian elections
- ❖ Where could one store the names, identification numbers, and electoral districts of voters?
- ❖ How could one sort them by alphabetical order of electoral districts and names?

7

Data Comes in Large Amounts

- ❖ Need to store data on secondary or tertiary storage
 - Cheaper, larger capacity
- ❖ Need to design efficient algorithms that consider the dominant cost of Input/Output operations (I/Os)
 - External sorting algorithms
- ❖ Need to remove duplicate entries

8

Data Comes in Homogeneous Collections

9

Data Comes in Homogeneous Collections

- ❖ Structured data
- ❖ DBMS implements access methods and indexing for efficient storage, update and retrieval

10

Integrity of Data should be Maintained

- ❖ How to maintain the integrity of data in spite of possible **application**, **system**, or **media failures**?
- ❖ Restore data to a consistent state after failures
- ❖ A **consistent state** of the database is a state which complies with the business rules as defined by **integrity constraints**
 - E.g. “students who have not passed CS2102 cannot take CS3223”

11

Integrity of Data should be Maintained

- ❖ Recovery
 - **Atomicity**: all actions in a **transaction** happen or none happen
 - **Durability**: effects of successful transactions last

12

What is a Transaction?

- ❖ A **transaction** is a **logical unit of work** carried out by a user or an application
- ❖ Examples:
 - Booking of vacation
 - A transaction involves booking flight tickets, land transfers and hotel rooms
 - Transfer of money from one bank account to another
 - A transaction involves withdrawing the amount from the first account and depositing it to the second account

13

Distributed and Concurrent Access

- ❖ How can data be **shared** by users and processes that are possibly **distributed** over a network?
- ❖ Ensure **consistent** data access and updates

14

Distributed and Concurrent Access

- ❖ Concurrency control
 - **Isolation:** Transactions can be understood independently from each other
 - **Consistency:** If individual transactions would leave the application in a consistent state, a concurrent execution should do the same

15

Security and Access Control of Data is Critical

- ❖ How to protect the data and define control access to data?
- ❖ Prevent unauthorized data access
- ❖ DCL (Database Control Language) include statements to administer access privileges and transactions properties

16

Describing Data in a DBMS

- ❖ A DBMS allows users to define and query data based on a data model
- ❖ A **data model** is a collection of concepts for describing data
- ❖ A **schema** is a description of the structure of a database using a data model
- ❖ A **schema instance** is the content of the database at a particular time

17

Relational Data Model

- ❖ Most DBMSs today are based on the relational data model
- ❖ RDMBS vendors: IBM, Microsoft, Oracle, Sybase
- ❖ Data is modeled using **relations**
- ❖ A relation is a table with rows and columns

18

Querying in a Relational DBMS

- ❖ A DBMS provides a database language for users to retrieve data
- ❖ Formal query languages
 - Relational algebra (based on operators for manipulating relations)
 - Relational calculus (based on mathematical logic)
- ❖ Commercial database languages
 - Structured Query Language (most widely used)
 - Query By Example (graphical)

19

To Summarize

A database application manages homogeneous collections of large amounts of persistent data that are shared among distributed users and processes, and whose integrity and security must be maintained.

20

Syllabus

❖ **Database Design**

- Entity Relationship Model
- Relational Model
- Normalisation with Functional Dependencies

❖ **Database Programming**

- Theory of Query Languages: Algebra and Calculus
- SQL
- SQL and Programming Languages

21

Texts & References

- **Database Management Systems**
by R. Ramakrishnan and J. Gehrke
McGraw-Hill, 3rd Edition, 2000
- **A First Course in Database Systems**
by J. Ullman and J. Widom
Prentice-Hall, 2nd Edition, 2002
- **Introduction to Database Systems**
by S. Bressan, B. Catania
McGraw-Hill, 2005

22

Course Schedule

- ❖ Lectures
 - Tuesday, 10 am – 12 pm
 - LT19
- ❖ Tutorials and Labs
 - Mondays and Thursdays, 2 hours
 - Start on Week 3

23

Assessments

- ❖ Final Exam (60%)
- ❖ Midterm Test (20%)
- ❖ Quiz (10%)
- ❖ Project (10%)

24

Project

- ❖ Objective of project is to apply the concepts and techniques learned for the design and programming of a database application
- ❖ Deliverables
 - Reports due Week 5 and Week 13
 - Demo of software
- ❖ Team of 3 students

25

Modes of Communication

- ❖ IVLE
 - Lesson Plan, Lecture Notes
 - Readings for the week, Tutorials, Lab Handouts
 - Submission of Project Reports
 - Gradebook
 - Forum discussion
- ❖ Email
