Introduction to Database Systems

Entity Relationship

- The Entity-relationship model is a graphical model for representing the conceptual model for the data centric design of an application

Introduction to Database Systems

Entities and Entity Sets

- Entities are identifiable “things”
- The named box represents a set of entities or entity set

Introduction to Database Systems

Attributes, Values and Value Sets

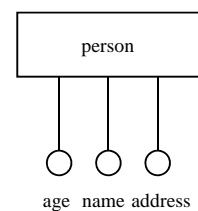

- The E-R model is value-oriented
- Values can be integer, strings, or atoms

Introduction to Database Systems

Attributes of Entities

- Entities can have attributes
- All entities in one entity set have the same attributes
- However the attributes take different values for each entities

Introduction to Database Systems

Relationships and Relationship Sets

- **Relationships**
- A lozenge represents a set of relationships or a relationship set

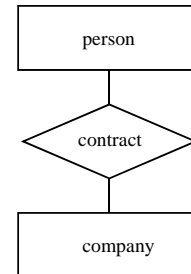

can be, not compulsory

Introduction to Database Systems

Relationships and Relationship Sets

- A relationship associates 2 or more entities
- A relationship set is a set of relationships associating entities from the same entity sets

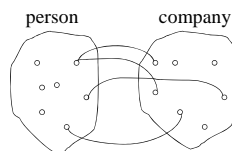

person and company can be in relationship with contract

Introduction to Database Systems

Relationships and Relationship Sets

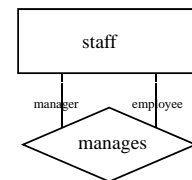

- A relationship associates 2 or more entities
- A relationship set is a set of relationships associating entities from the same entity sets

Introduction to Database Systems

Relationships and Relationship Sets

- **Relationships can associate entities from the same entity set**
- In this case and in general, participation, or role, in the relationship can be named

roles

Introduction to Database Systems

Relationships and Relationship Sets

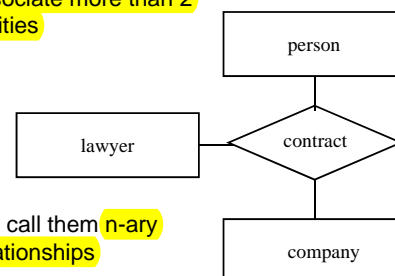

- Relationships can associate entities from the same entity set
- In this case and in general, participation, or role, in the relationship can be named

Introduction to Database Systems

Relationships and Relationship Sets

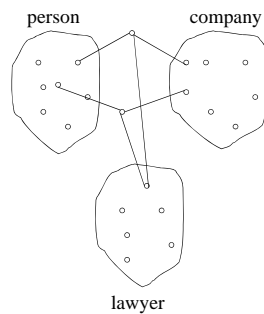

- **A relationship can associate more than 2 entities**
- We call them **n-ary relationships**

Introduction to Database Systems

Relationships and Relationship Sets

- A relationship can associate more than 2 entities

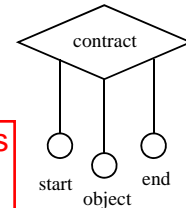

- We call them n-ary relationships

Introduction to Database Systems

Attributes of Relationships

- Relationship can have attributes
- All relationships in one relationship set have the same attributes

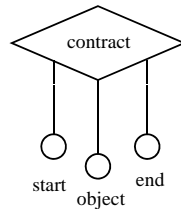

qn: will the attributes be genuine to the relationship/entity?

Introduction to Database Systems

if we dun want a relationship to have attributes, trans to entity

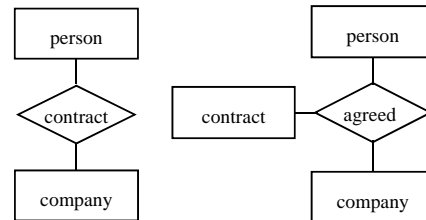

Attributes of Relationships

- Relationships are distinguished not by their attributes but by their participating entities

Introduction to Database Systems

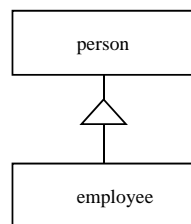

Entity or Relationship?

Introduction to Database Systems

Hierarchies: Subset/Supersets

- It is possible to require that an entity set be a subset of another entity set (its superset)

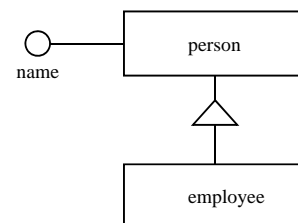

Introduction to Database Systems

dun use hierarchy. not tested

Hierarchies: Inheritance

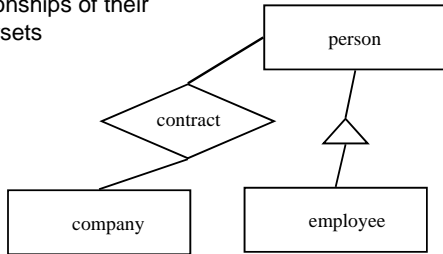

- Entities in the subsets inherit the attributes of their supersets

Introduction to Database Systems

Hierarchies: Inheritance

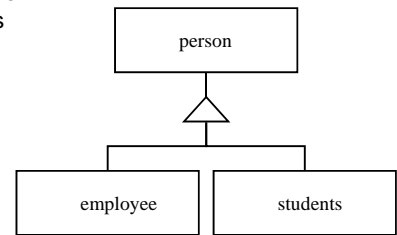

- Entities in the subsets can participate in the relationships of their supersets

Introduction to Database Systems

Hierarchies: Generalization/Specialization

- This construction can help design specialization hierarchies

Introduction to Database Systems

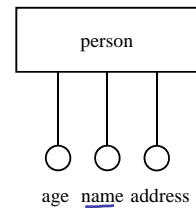

Conceptual Modelling

Integrity

Introduction to Database Systems

Entities' Identity

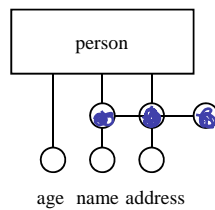

- One attribute can identify the entity
- This is a property of all entities in an entity set
- Notice: at least all attributes identify the entity*

Introduction to Database Systems

Entities' Identity

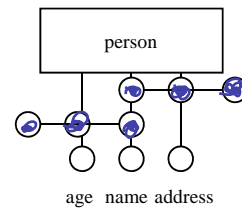

- A combination of attributes can identify the entity

Introduction to Database Systems

Entities' Identity

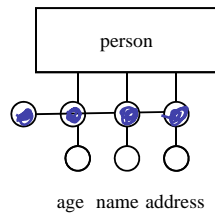

- There might be several possible combination of attributes to identify an entity

Introduction to Database Systems

Entities' Identity

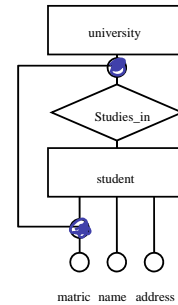

- Notice: at least all attributes identify the entity
- But we might prefer a minimum set of attributes

Introduction to Database Systems

Weak Entities

any attribute in the entity uni can be comb with matric no to form pri key

Introduction to Database Systems

Weak Entities

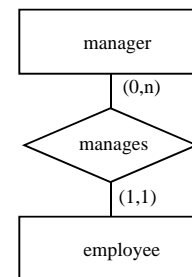

- Some entities can only be identified within the scope of a relationship with another entity set
- Notice that the relationship must exist and be unique for each entity in the set

Introduction to Database Systems

Relationships' Cardinality

- The cardinality of the participation in a relationship can be constrained by a minimum and maximum value:

(1,1)
(0, n)
(2, 5)

manager manage at least 0 and at most n employees

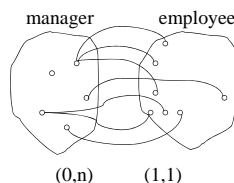

employee must have at least and at most 1 manager

Introduction to Database Systems

Relationships' Cardinality

- The cardinality of the participation in a relationship can be constrained by a minimum and maximum value:

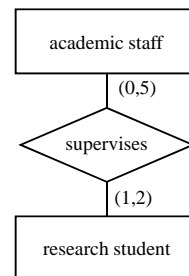

(1,1)
(0, n)
(2, 5)

Introduction to Database Systems

Relationships' Cardinality

- Another example

Introduction to Database Systems

Relationships' Cardinality

- $(1, x)$ mandatory participation
- $(0, x)$ optional participation

Introduction to Database Systems

Relationships' Cardinality

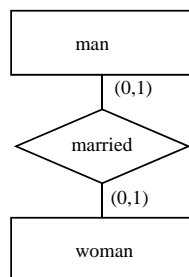

- $(x, 1)$ for all entities involved characterizes a one-to-one relationship
- $(x, 1)$ for one entity involved and (x, N) or (x, y) $y > 1$ for the others characterizes a one-to-many relationship
- (x, N) or (x, y) $y > 1$ for all entities involved characterizes a many-to-many relationship

Introduction to Database Systems

Relationships' Cardinality

- Example of a one-to-one relationship

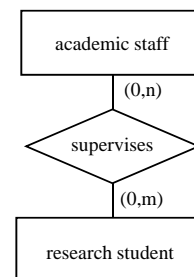

optional
relationship

Introduction to Database Systems

Relationships' Cardinality

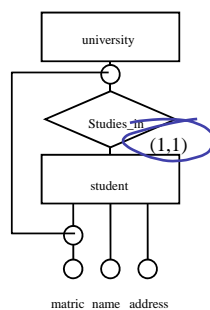

- By default we have many-to-many relationships

Introduction to Database Systems

Weak Entities

- Weak entities can only be defined for a participation constrained by $(1,1)$ cardinalities
- Also called mandatory one-to-many relationships

Introduction to Database Systems

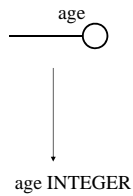

Conceptual to Logical Design

From E-R to Relational
Textbook Section 3.5

Introduction to Database Systems

Value Sets

- Value sets are mapped to domains
- *In practice this is a first step towards the physical design*
- E-R attributes are mapped to attributes of relations

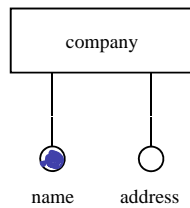

Introduction to Database Systems

Entity Sets

- Entity sets are mapped to relations
- The entity set attributes are mapped to attributes of the relation
- The keys are mapped to primary key

Introduction to Database Systems

Entity Sets

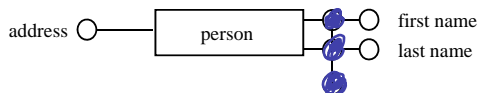

Introduction to Database Systems

Entity Sets

```
CREATE TABLE company
(
  name VARCHAR(64) PRIMARY KEY,
  address VARCHAR(128),
)
```

Introduction to Database Systems

Entity Sets

Introduction to Database Systems

Entity Sets

```
CREATE TABLE person
(
  first_name VARCHAR(32),
  last_name VARCHAR(32),
  address VARCHAR(128),
  PRIMARY KEY (first_name, last_name))
```

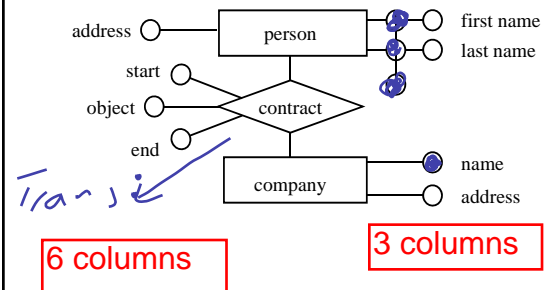

Introduction to Database Systems

Relationship Sets

- Relationship sets are mapped to relations
- The attributes of the relation consist of the attributes of the relationship set
- As well as of the keys of the participating entities

Introduction to Database Systems

Relationship Sets

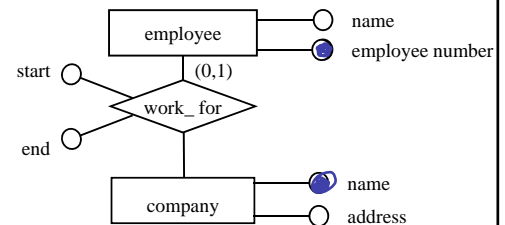

Introduction to Database Systems

Relationship Sets

```
CREATE TABLE contract
(
  start DATE,
  end DATE,
  object VARCHAR(128),
  pfirst_name VARCHAR(32),
  plast_name VARCHAR(32),
  cname VARCHAR(64),
  PRIMARY KEY (pfirst_name, plast_name, cname),
  FOREIGN KEY (pfirst_name, plast_name) REFERENCES
  person(first_name, last_name),
  FOREIGN KEY (cname) REFERENCES company(name)
)
```

Introduction to Database Systems

Key Constraints (one-to-many relationships)

Introduction to Database Systems

Key Constraints (one-to-many relationships)

```
CREATE TABLE work_for
(
  start DATE,
  end DATE,
  enumber CHAR(8),
  cname VARCHAR(32),
  PRIMARY KEY (enumber, cname),
  FOREIGN KEY (enumber) REFERENCES
  employee(number),
  FOREIGN KEY (cname) REFERENCES
  company(name)
)
```

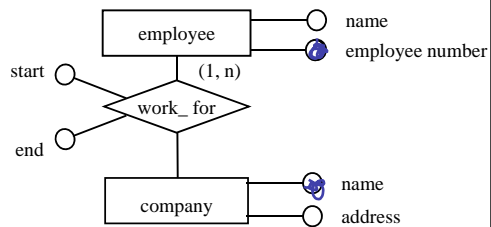

Introduction to Database Systems

Key Constraints (one-to-many relationships)

```
CREATE TABLE work_for
(
  start DATE,
  end DATE,
  enumber CHAR(8) PRIMARY KEY,
  cname VARCHAR(32),
  FOREIGN KEY (enumber) REFERENCES
  employee(number),
  FOREIGN KEY (cname) REFERENCES
  company(name)
)
```

Introduction to Database Systems

Participation Constraints

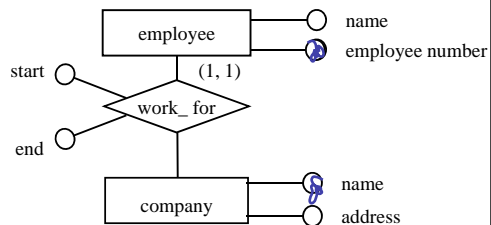

Introduction to Database Systems

Participation Constraints

```
CREATE TABLE work_for
(
    start DATE,
    end DATE,
    enumber CHAR(8),
    cname VARCHAR(32),
    PRIMARY KEY (enumber, cname),
    FOREIGN KEY (enumber) REFERENCES
    employee(number),
    FOREIGN KEY (cname) REFERENCES
    company(name)
)
```

Introduction to Database Systems

Key and Participation Constraints

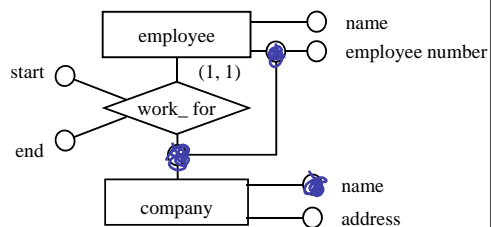

Introduction to Database Systems

Key and Participation Constraints

```
CREATE TABLE employee_work_for
(
    start DATE,
    end DATE,
    enumber CHAR(8) PRIMARY KEY,
    ename CHAR(32),
    cname VARCHAR(32),
    FOREIGN KEY (cname) REFERENCES
    company(name)
)
```

Introduction to Database Systems

Weak Entity Sets

Introduction to Database Systems

Weak Entity Sets

```
CREATE TABLE employee_work_for
(
    start DATE,
    end DATE,
    enumber CHAR(8) PRIMARY KEY,
    ename CHAR(32),
    cname VARCHAR(32),
    FOREIGN KEY (cname) REFERENCES
    company(name)
)
```

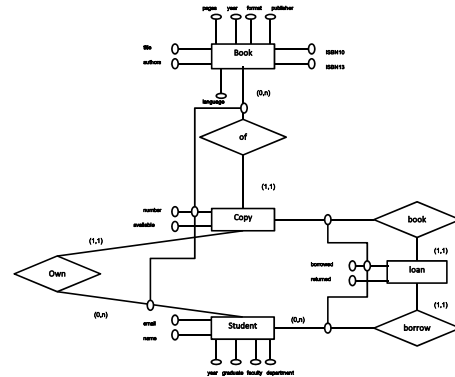

cannot cos employee no and comp name must be used

Weak Entity Sets

```
CREATE TABLE employee_work_for
(
  start DATE,
  end DATE,
  enumber CHAR(8),
  ename VARCHAR(32),
  PRIMARY KEY (enumber, cname),
  FOREIGN KEY (cname) REFERENCES
  company(name)
)
```

Introduction to Database Systems

Entity-relationship Diagram from theTutorial

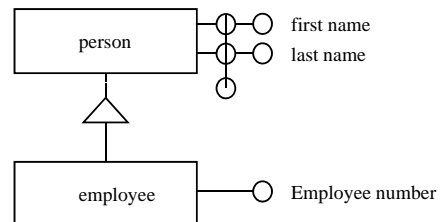

Introduction to Database Systems

Hierarchies

- Hierarchies can be mapped to relations in different ways, e.g.:
 - Horizontal mapping
 - Vertical mapping

Introduction to Database Systems

Hierarchies

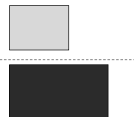

Introduction to Database Systems

Hierarchies: Horizontal Mapping

```
CREATE TABLE person
(
  first_name VARCHAR(32),
  last_name VARCHAR(32),
  address VARCHAR(128),
  PRIMARY KEY (first_name, last_name)
)

CREATE TABLE employee
(
  first_name VARCHAR(32),
  last_name VARCHAR(32),
  address VARCHAR(128),
  employee_number INTEGER PRIMARY KEY
)
```

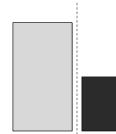

Introduction to Database Systems

Hierarchies: Vertical Mapping

```
CREATE TABLE person
(
  first_name VARCHAR(32),
  last_name VARCHAR(32),
  address VARCHAR(128),
  PRIMARY KEY (first_name, last_name)
)

CREATE TABLE employee
(
  first_name VARCHAR(32),
  last_name VARCHAR(32),
  employee_integer PRIMARY KEY,
  FOREIGN KEY (first_name, last_name) REFERENCES
  person(first_name, last_name) ON DELETE CASCADE
)
```

Introduction to Database Systems

Credits

The content of this lecture is based
on chapter 7 of the book
"Introduction to database
Systems"
