# **Functional Dependencies**

Presented by Stéphane Bressan

#### Anomalies: Example

Assume that the position determines the salary:  $position \rightarrow salary$ 

| eNumber           | firstName | lastName | address            | depart<br>ment | Position          | salary |  |
|-------------------|-----------|----------|--------------------|----------------|-------------------|--------|--|
| 1XU3              | Dewi      | Srijaya  | 12a Jln Lempeng    | Toys           | Clerk             | 2000   |  |
| 4W3E              | Izabel    | Leong    | 10 Outram Park     | Sports         | Trainee           | 1200   |  |
| 3XXE              | John      | Smith    | 107 Clementi Rd    | Toys           | Clerk             | 2000   |  |
| 5SD2              | Axel      | Bayer    | 55 Cuscaden Rd     | Sports         | Trainee           | 1200   |  |
| 6RG5              | Winnie    | Lee      | 10 West Coast Rd   | Sports         | Manager           | 2500   |  |

key

#### **Learning Objectives**

- Definitions
- Reasoning (Armstrong's axioms)
- Closure and Equivalence
- Minimal Cover

For a relation scheme R, a functional dependency from a set S of attribute of R to a set T of attribute of R exists if and only if:

For every instance of |R| of R, if two t-uples in |R| agree on the values of the attributes in S, then they agree on the values of the attributes in T.

We write:  $S \rightarrow T$ 

company(eNumber, firstName, lastName, address, department, position, salary)

 $\{position\} \rightarrow \{salary\}$ 

If two t-uples in the relation company have the same value for the attribute position then they must have the same value for the salary attribute.

employee(eNumber, firstName, lastName, address, department, position)

{firstName, lastName} → {eNumber, address, department, position}

If two t-uples in the relation employee relation have the same first name and last name then they must are the same t-uple (no duplicate)

company(enumber, firstname, lastname, address, department, position, salary)

 $\{position\} \rightarrow \{salary\}$ 

```
\forallX1 \forallX2 \forallX3 \forallX4 \forallX5 \forallX6 \forallX7 \forallX8 \forallX9 \forallX10 \forallP \forallS1 \forallS2 ((company(X1, X2, X3, X4, X5, P, S1) 
 \land company(X6, X7, X8, X9, X10, P, S2)) 
 \Rightarrow (S1 = S2))
```

company(enumber, firstname, lastname, address, department, position, salary)

 $\{position\} \rightarrow \{salary\}$ 

```
CHECK ( NOT EXISTS (
SELECT *
FROM company c1, company c2
WHERE c1.position=c2.position AND c1.salary <> c2.salary))
```

```
salary(position, salary)
```

 $\{position\} \rightarrow \{salary\}$ 

```
CHECK ( NOT EXISTS (
SELECT *
FROM salary s1, salary s2
WHERE s1.position=s2.position AND s1.salary <> s2.salary))
```

PRIMARY KEY (position)

#### **Trivial FDs**

$$X \rightarrow Y$$

$$Y \subset X$$

{firstName, address} → {firstName}

#### Non-Trivial FDs

$$X \rightarrow Y$$

$$\mathbf{Y} \subset \mathbf{X}$$

```
{eNumber} → {address}

{firstName, lastName} → {firstName, address}
```

### Completely Non-Trivial FDs

$$X \rightarrow Y$$

$$Y \cap X = \emptyset$$

{firstName, lastName} → {address}

#### Superkeys

A set of attributes whose knowledge determines the value of the entire t-uple is a superkey

employee(eNumber, firstName, lastName, address, department, position, salary)

```
{firstName, lastName}
{eNumber}
{firsName, lastName, address}
{eNumber, address}
```

### Candidate Keys

A minimal (for inclusion) set of attributes whose knowledge determines the value of the entire t-uple is a **candidate key** 

employee(eNumber, firstName, lastName, address, department, position, salary)

```
{firstName, lastName}
{eNumber}
```

#### **Primary Keys**

The designer chooses one candidate key to be the **primary key** 

## Reasoning about Functional Dependencies

It is sometimes possible to infer new functional dependencies from a set of given functional dependencies

(independently from any particular instance of the relation scheme or of any additional knowledge)

### Reasoning about Functional Dependencies

```
For example:
From
{eNumber} → {firstName}
and
{eNumber} →{lastName}
```

```
We can infer {eNumber} → {firstName, lastName}
```

- Be X, Y, Z be subsets of the relation scheme of a relation R
- Reflexivity:

If  $Y \subset X$ , then  $X \rightarrow Y$ 

Augmentation:

If 
$$X \rightarrow Y$$
, then  $X \cup Z \rightarrow Y \cup Z$ 

Transitivity:

If 
$$X \rightarrow Y$$
 and  $Y \rightarrow Z$ , then  $X \rightarrow Z$ 

employee(eNumber, firstName, lastName, address, department, position, salary)

## Reflexivity:

If {firstName} ⊂ {firstName, lastName},
Then {firstName, lastName} → {firstName}

employee(eNumber, firstName, lastName, address, department, position, salary)

## **Augmentation:**

```
If \{position\} \rightarrow \{salary\},\
then \{position, eNumber\} \rightarrow \{salary, eNumber\}
```

employee(eNumber, firstName, lastName, address, department, position, salary)

## **Transitivity**:

```
If \{eNumber\} \rightarrow \{position\}
and \{position\} \rightarrow \{salary\},
Then \{eNumber\} \rightarrow \{salary\}
```

Armstrong's axioms are sound

For example: Transitivity Let X, Y, Z be subsets of the relation R If  $X\rightarrow Y$  and  $Y\rightarrow Z$ , then  $X\rightarrow Z$ 

#### Proof:

- 1. Let R be a relation scheme.
- 2. Let  $X \rightarrow Y$  and  $Y \rightarrow Z$  be two functional dependencies on R.
- 3. Let T1 and T2 be two tuples of |R| are such that, for all attributes Ax in X, T1. Ax = T2.Ax.
- 4. We know that for all Ay in Y, T1. Ay = T2.Ay since  $X \rightarrow Y$
- 5. We know that for all Ay in Y, T1. Ay = T2.Ay since  $Y \rightarrow Z$
- 6. Therefore for all Az in Z, T1. Az = T2.Az
- 7. Therefore  $X \rightarrow Z$

Q.E.D

#### Armstrong's axioms are sound

For example: Consider the scheme {name, room, tel} with the set of functional dependencies:

$$\{\{\text{room}\} \rightarrow \{\text{tel}\}, \{\text{tel}\} \rightarrow \{\text{name}\}\}$$

We can deduce that the following functional dependency holds:

$$\{\text{room}\} \rightarrow \{\text{name}\}$$

#### Proof:

- 1. Let R= {name, room, tel}
- 2. Let  $\{room\} \rightarrow \{tel\}$  be a functional dependency on R
- 3. Let  $\{tel\} \rightarrow \{name\}$  be a functional dependency on R
- Therefore {room} → {name} holds on R by Transitivity of (2) and (3)
   Q.E.D.

Armstrong's axioms are sound

For example: Weak-Augmentation Let X, Y, Z be subsets of the relation R

If 
$$X \rightarrow Y$$
, then  $X \cup Z \rightarrow Y$ 

#### **Proof**

- Let R be a relation scheme
- 2. Let  $X \rightarrow Y$  be a functional dependency on R
- 3. Therefore  $X \cup Z \rightarrow Y \cup Z$  by Augmentation of (2) with Z
- 4. We know that  $Y \cup Z \rightarrow Y$  by Reflexivity because  $Y \subset Y \cup Z$
- 5. Therefore  $X \cup Z \rightarrow Y$  by Transitivity of (3) and (4) Q.E.D.

### Closure of a Set of Functional Dependencies

For a set F of functional dependencies, we call the closure of F, noted F+, the set of all the functional dependencies that F entails

Armstrong's axioms are complete

F+ can be computed by applying the Armstrong Axioms in all possible ways

#### Closure of a Set of Functional Dependencies

Consider the relation scheme R(A,B,C,D)

- $F = \{\{A\} \rightarrow \{B\}, \{B,C\} \rightarrow \{D\}\}$
- F+ = {{A} →{A}, {B}→{B}, {C}→{C}, {D}→{D}, [...], {A}→{B}, {A,B}→{B}, {A,D}→{B,D}, {A,C}→{B,C}, {A,C,D}→{B,C,D}, {{A} →{A,B}, {A,B}→{A,B}, {A,D}→{A,B,D}, {A,C}→{A,B,C}, {A,C,D}→{A,B,C,D}, {B,C} →{D}, [...], {A,C} →{D}, [...]}

Equivalence of Sets of Functional Dependencies

Two sets of functional dependencies F and G are equivalent if and only if

$$F+=G+$$

Finding Keys: Example

Example: Consider the relation scheme R(A,B,C,D)

with functional dependencies:

$$\{A\} \rightarrow \{C\} \text{ and } \{B\} \rightarrow \{D\}.$$

Is {A,B} a candidate key?

Finding Keys: Example

Example: {A,B} is a superkey.

**Proof** 

- 1. We know that  $\{A\} \rightarrow \{C\}$
- Therefore {A,B} → {A,B,C}, by augmentation of (1) with{A,B}
- 3. We know that  $\{B\} \rightarrow \{D\}$
- 4. Therefore {A,B,C} → {A,B,C,D}, by augmentation of (3) with {A, B, C}
- 5. Therefore {A,B} →{A,B,C,D} by transitivity of(2) and (4)

Q.E.D

Finding Keys: Example

Example: {A,B} is a candidate key (minimal)

We must show that neither {A} nor {B} alone are candidate keys

This can be done by producing counter example relation instance verifying the functional dependencies given but neither  $\{A\} \rightarrow \{A,B,C,D\}$  nor  $\{B\} \rightarrow \{A,B,C,D\}$ 

We will however learn an algorithm to do otherwise

#### Closure of a Set of Attributes

For a set A of attributes, we call the **closure** of A (with respect to a set of functional dependencies F), noted A+, the maximum set of attributes such that  $A \rightarrow A+$  (as a consequence of F)

Closure of a Set of Attributes: Example

Consider the relation scheme R(A,B,C,D) with functional dependencies

$$\{A\} \rightarrow \{C\} \text{ and } \{B\} \rightarrow \{D\}.$$

- $\{A\}+=\{A,C\}$
- $\{B\}$ + =  $\{B,D\}$
- $\{A,B\}$ + =  $\{A,B,C,D\}$

### Closure of a Set of Attributes: Algorithm 1

- Input:
  - R a relation scheme
  - F a set of functional dependencies
  - X ⊂ R
- Output:
  - X+ the closure of X w.r.t. F

## Closure of a Set of Attributes: Algorithm 1

- X<sup>(0)</sup> := X
- Repeat
  - $X^{(i+1)} := X^{(i)} \cup A$ , where A is the union of the sets Z of attributes such that there exist Y  $\rightarrow$  Z in F, and Y  $\subset X^{(i)}$
- Until X<sup>(i+1)</sup> := X<sup>(i)</sup>
- Return X<sup>(i+1)</sup>

## Closure of a Set of Attributes: Example

$$R = \{A,B,C,D,E,G\}$$

$$F = \{ \{A,B\} \rightarrow \{C\}, \{C\} \rightarrow \{A\}, \{B,C\} \rightarrow \{D\}, \\ \{A,C,D\} \rightarrow \{B\}, \{D\} \rightarrow \{E,G\}, \{B,E\} \rightarrow \{C\}, \\ \{C,G\} \rightarrow \{B,D\}, \{C,E\} \rightarrow \{A,G\} \}$$

$$X = \{B,D\}$$

#### Closure of a Set of Attributes: Example

$$\begin{split} R &= \{A,B,C,D,E,G\} \\ F &= \{ \{A,B\} \rightarrow \{C\}, \{C\} \rightarrow \{A\}, \{B,C\} \rightarrow \{D\}, \{A,C,D\} \rightarrow \{B\}, \{D\} \rightarrow \{E,G\}, \\ \{B,E\} \rightarrow \{C\}, \{C,G\} \rightarrow \{B,D\}, \{C,E\} \rightarrow \{A,G\}\} \\ X &= \{B,D\} \end{split}$$

$$X^{(0)} = \{B, D\}$$

• 
$$\{D\} \rightarrow \{E,G\}$$

• 
$$X^{(1)} = \{B, D, E, G\}$$

$$\blacksquare \{B,E\} \rightarrow \{C\},\$$

• 
$$X^{(2)} = \{B,C,D,E,G\}$$

• 
$$\{C,E\} \rightarrow \{A,G\}$$

$$X^{(3)} = X^{(4)} = X + = \{A,B,C,D,E,G\}$$

# Equivalence of Sets of Functional Dependencies

Every set F of functional dependencies is equivalent to a set of functional dependencies Y→Z such that Z is a singleton, i.e. every right-hand side has a single attribute

## Minimal Set of Dependencies

- A set of dependencies F is minimal if and only if:
  - 1. Every right-hand side is a single attribute
  - For no functional dependency X→A in F and proper subset Z of X is F {X→A} ∪ {Z→A} equivalent to F
  - 3. For no functional dependency  $X \rightarrow A$  in F is the set  $F \{X \rightarrow A\}$  equivalent to F

#### **Minimal Cover**

A set of functional dependencies F is a minimal cover of a set of functional dependencies G if and only if

- F is minimal
- F is equivalent to G

 (an <u>extended minimal cover</u> is obtained bu undoing step 1)

#### Minimal Cover

- Every set of functional dependencies has a minimal cover
- There might be several different minimal cover of the same set

## Minimal Cover: Example

F = { 
$$\{A,B\}\rightarrow\{C\}, \{C\}\rightarrow\{A\}, \{B,C\}\rightarrow\{D\}, \{A,C,D\}\rightarrow\{B\}, \{D\}\rightarrow\{E,G\}, \{B,E\}\rightarrow\{C\}, \{C,G\}\rightarrow\{B,D\}, \{C,E\}\rightarrow\{A,G\}\}$$

## Minimal Cover: Example (1)

F = { {A,B}
$$\rightarrow$$
{C}, {C} $\rightarrow$ {A}, {B,C} $\rightarrow$ {D}, {A,C,D} $\rightarrow$ {B}, {D} $\rightarrow$ {E,G}, {B,E} $\rightarrow$ {C}, {C,G} $\rightarrow$ {B,D}, {C,E} $\rightarrow$ {A,G}}

F' = { {A,B}
$$\rightarrow$$
{C}, {C} $\rightarrow$ {A}, {B,C} $\rightarrow$ {D}, {A,C,D} $\rightarrow$ {B}, {D} $\rightarrow$ {G}, {D} $\rightarrow$ {E}, {B,E} $\rightarrow$ {C}, {C,G} $\rightarrow$ {B}, {C,G} $\rightarrow$ {D}, {C,E} $\rightarrow$ {A}, {C,E} $\rightarrow$ {G}}

## Minimal Cover: Example (2)

F' = 
$$\{\{C\}\rightarrow \{A\}, \{C,E\}\rightarrow \{A\}, \{A,C,D\}\rightarrow \{B\}, \{C,G\}\rightarrow \{B\}, \{A,B\}\rightarrow \{C\}, \{B,E\}\rightarrow \{C\}, \{B,C\}\rightarrow \{D\}, \{C,G\}\rightarrow \{D\}, \{D\}\rightarrow \{E\}, \{C,E\}\rightarrow \{G\}, \{D\}\rightarrow \{G\}\}$$

F" = 
$$\{\{C\}\rightarrow \{A\}, \{C,D\}\rightarrow \{B\}, \{C,G\}\rightarrow \{B\}, \{A,B\}\rightarrow \{C\}, \{B,E\}\rightarrow \{C\}, \{B,C\}\rightarrow \{D\}, \{C,G\}\rightarrow \{D\}, \{D\}\rightarrow \{G\}\}$$

## Minimal Cover: Example (3)

F" = 
$$\{\{C\}\rightarrow\{A\}, \{C,D\}\rightarrow\{B\}, \{C,G\}\rightarrow\{B\}, \{A,B\}\rightarrow\{C\}, \{B,E\}\rightarrow\{C\}, \{B,C\}\rightarrow\{D\}, \{C,G\}\rightarrow\{D\}, \{D\}\rightarrow\{G\}\}\}$$

F"' = 
$$\{\{C\}\rightarrow \{A\}, \{C,D\}\rightarrow \{B\}, \{A,B\}\rightarrow \{C\}, \{B,E\}\rightarrow \{C\}, \{B,C\}\rightarrow \{D\}, \{C,G\}\rightarrow \{D\}, \{C,E\}\rightarrow \{G\}, \{D\}\rightarrow \{G\}\}$$

# Extended Minimal Cover: Example (4)

F"" = 
$$\{\{C\}\rightarrow\{A\}, \{C,D\}\rightarrow\{B\}, \{A,B\}\rightarrow\{C\}, \{B,E\}\rightarrow\{C\}, \{B,C\}\rightarrow\{D\}, \{C,G\}\rightarrow\{D\}, \{C,G\}\rightarrow\{D\}, \{C,E\}\rightarrow\{G\}\}\}$$

Minimal Cover: Algorithm

We can apply steps (1), (2), (3) iteratively in various orders

However only (1) + (2) + (3) is guaranteed to lead to a minimal cover!:

- Put functional dependencies in single attribute rhs form
- Minimize left side of each functional dependency
- Delete redundant functional dependencies
